

Machine Test 1: Weather Dashboard Web Application

Tech Stack

Mandatory

- HTML
- CSS
- JavaScript
- PHP (Core PHP / Laravel / CodeIgniter)

Optional

- Bootstrap 5
 - jQuery
-

Objective

Build a responsive single-page weather dashboard application using any public Weather API.

The application should allow users to search for a city and view real-time weather information.

API Requirement

Candidate can use any public weather API.

Suggested APIs

- OpenWeather API

- WeatherAPI
 - AccuWeather API
-

Functional Requirements

1. Single Page Weather Dashboard

Create a clean and responsive single-page application.

2. Search Functionality

Provide:

- Search input field
- Search button

User should be able to search weather using:

- City Name

Example

- Bangalore
 - Chennai
 - Mumbai
 - Delhi
-

3. Weather Information Display

After searching, display:

- City Name
- Temperature

- Weather Condition
 - Weather Icon
 - Humidity
 - Wind Speed
 - Feels Like Temperature
 - Current Date & Time
-

4. API Integration

Requirements:

- Fetch real-time weather data from API
- Handle API errors properly
- Show loading state while fetching data

Example Error Cases

- Invalid city name
 - API failure
-

Bonus Features (Optional)

- Detect current location weather
 - 5-day forecast
 - Auto search on Enter key
-

Submission Guidelines

Developer must submit:

- Source code (GitHub repo or ZIP)
- README file with:
 - Setup instructions

- API key configuration steps

Important Notes

- API integration must be functional
- Clean and readable code is important
- Mobile responsiveness is mandatory
- Proper validation and error handling should be implemented
